Let's Start!

Ways of Dealing with Data

Learning Outcome:

Implement data migration processes and data backups within the IT solution.

Understand the different types of data movements, making an emphasis on data migration movements as well as data backups.

Can Do Statements:

- I can describe the different types of data movement.
- I can explain what data migration is.
- I can talk about the importance of data migration.

Ask your partner:

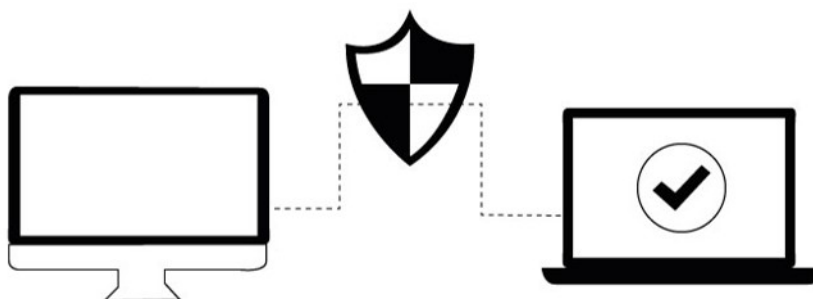

- Have you ever lost valuable information that you couldn't get back? If so, how did you lose it?
- How many ways to store information do you know? Describe them.

Let's Explore!

Listen to the following introduction to data movement

Instructions: Read the text below.

Data migration is a very important must have for every company or project. Moving data allows users to apply changes or transfer information from one system to another, like to a storage or database. It is usually done when updating or changing software, or when different systems need to be merged in one. Moving data might not be easy but being prepared is something that totally pays off. People can't trust only on the fact that they're doing their jobs well; it is necessary to have sort of a backup.

There are different types of data movement that imply different processes and sources. Consolidation may not be the most popular, but it is the one in charge of collecting data coming from different sources and putting all together in a single point or destination. Migration, which is the most used, implies moving data from one source to another. Upgrading, instead, is the data movement people perform when setting up a newer version of software. The last one is integration, which consists of the combination or consolidation of data from different sources under a unique data system, allowing a unified view of the information.

Migration prevents the loss of data that might be essential for companies or project development. In the same way, data movement prevents fraud when done properly, especially in institutions where personal information is handled. It also favors the management of true information under one base which eases any kind of transaction or process that requires verification. Finally, a proper use of information makes people work better by not squandering time and resources wondering or panicking when something goes wrong.

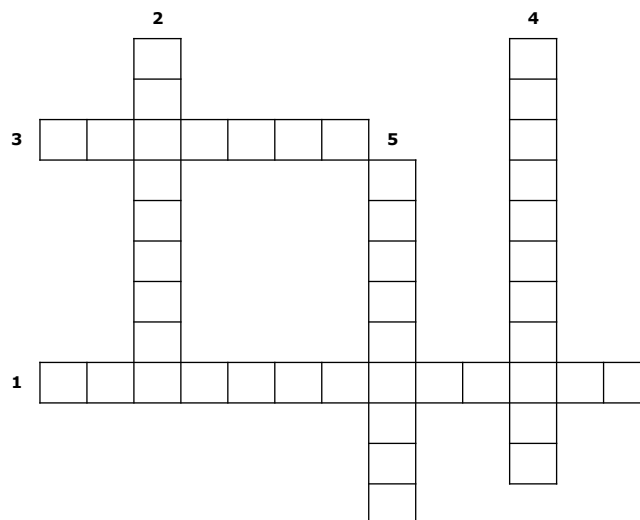

Let's Practice!

Please check the vocabulary before moving the data.

Instructions: Read the clues. Complete the crossword.

CLUES

1. The action of collecting and conveying in a single destination.
2. Information movement necessary between sources.
3. A new version or characteristic for an existing product.
4. It implies combination and consolidation.
5. The action of getting or installing a better version of software.

Let's Practice!

Data Migration Importance for New Business and Old Companies

Instructions: Choose the correct option to complete the sentences.

1. Migrating data prevents data loss _____ might be essential for companies or project development.
a. that b. which c. who d. when
2. Data movement prevents fraud when done properly, especially in institutions _____ personal information is handled.
a. where b. when c. which d. that
3. It also favors the management of true information under one base, which eases any kind of transaction or process _____ requires verification.
a. that b. where c. who d. whose
4. People work better and not harder by not squandering time and resources wondering or panicking _____ something goes wrong.
a. when b. why c. whose d. who
5. Proper use of information promotes easier ways to access it _____ people need it.
a. when b. where c. who d. that

Extension Activity

Design a migration process to your company

Instructions: Complete the following steps. Fill in the Self-Assessment.

- On the internet, look for more information about data migration process.
- Write information about how often is it advisable carried out, and how is it?
- Design a process which you show the process and the variables to carry out.
- Share the information with your instructor.

Self-Assessment

Yes

No

- I browse for information about data migration process. ☐ ☐
- I create a short text with information about how to do it. ☐ ☐
- I describe the data migration process and talk about it. ☐ ☐

Target Words

- must have** (expression): something so necessary it can't be overlooked.
e.g. Data migration is a very important must have in every company or project.
- put something together** (phrasal verb): to assemble or gather something.
e.g. Consolidation may not be the most popular, but it is the one in charge of collecting data coming from different sources and putting all together in a single point or destination.
- upgrading** (noun): the action of getting or installing a better version of software.
e.g. Upgrading, instead, is the data movement people perform when setting up a newer version of software.
- favor** (verb): to give a benefit or advantage.
e.g. It also favors the management of true information under one base which eases any kind of transaction or process that requires verification.
- ease** (verb): to facilitate or make easier.
e.g. It also favors the management of true information under one base which eases any kind of transaction or process that requires verification.
- squander** (verb): to waste or not to fully take advantage.
e.g. Finally, a proper use of information makes people work better by not squandering time and resources wondering or panicking when something goes wrong.

Learning Points

Modal Verbs for Speculating Negative Forms

There are **Modal Verbs** used to make assumptions about something you don't know is going to happen or not.

In English language, there are verbs with different functions depending on the context and tense they are used. In this case, we use the **modal verbs express speculation** to talk about something that is likely to happen.

They can be used in negative statements as well expressing the idea in a more skeptical way. For example, if your friend did not come to work, you could think he or she is sick, but another friend doesn't think that because he or she considers your friend as a very healthy person. In such situation, a modal in negative may express disagreement and skepticism.

Modal verbs are **could, may, might, must, and will**.

The structure that we follow to use these **modals of speculation** in the **negative form** is this:

Subject + **modal verb** + **not** + verb + complement

Remember that you can use the contracted form of some verbs plus the negative particle:

Could not – Couldn't

Must not – Mustn't

Will not – Won't

Examples:

*Anna **couldn't** be sick. I saw him yesterday, and she looked perfect.*

*These data **may not** work properly for our tasks; let's use other database.*

*Jonah didn't come to work. He **might be** sick.*

*Our work **won't** be efficient if we don't get the appropriate data.*

Examples

- *Moving data might not be easy but being prepared is something that totally pays off.*
- People can't trust only on the fact that they're doing their jobs well; it is necessary to have sort of a backup.

Learning Points

Types of Data Movements

There are different types of **Data Movements** that may fit different types of data and different requests.

Data movement implies manipulation of invaluable information and thus, such manipulation should be done under controlled conditions to avoid data loss.

The main types of data movement are:

Consolidation, where data coming from different sources is collected and conveyed in a single destination. It allows having a full inventory of information under one system.

Migration which is done when data needs to be moved from one source to another.

Upgrade is done when new software or a new version of the system is about to be installed, and information needs to be placed in the new system.

Integration which implies the combination and consolidation of data from a variety of sources under a sole data system, this allows people to access information more easily and faster.
