Software Testing Types and Purposes

Learning Outcome:

Implement and document the software tests, applying trial and error, based on the designed plan and procedures established by the company.

Applies the different types of software testing to the IT solution.

Ask your partner:

- What kind of software do you consider needs more testing before being released? Why?
- How do you imagine testing occurs in videogames?

Can Do Statements:

- I can talk about beta testing and acceptance testing.
- I can describe stress testing characteristics.
- I can explain comparison and compatibility testing.

Let's Explore!

Carl asks Edna to help him out.

Instructions: Read the text below.

Carl: Hi, Edna. Would you help me with my assignment?

Edna: Sure! Is it about software testing? I know you've been taking some classes to improve your knowledge on computers.

Carl: Indeed. I just need a little help with some testing types I forgot to research about. The first two are closely related, I think, the Beta and Acceptance testing.

Edna: Ok. The Beta is performed by end-users before the software is released to the market. The acceptance test requires the user or customers to test the system to see if it meets the requirements.

Carl: If you can explain to me the difference, it will help me a lot. I don't understand what the difference is.

Edna: The Beta allows users to use the product and they provide feedback. The acceptance is the final testing performed by users. Got it?

Carl: It's crystal clear! If I want to push the limits of software, what testing will I have to use?

Edna: Stress testing definitely. You have to test the product under difficult and demanding conditions. It stretches the system's limits. Programmers may create special conditions to go beyond the system's capacities.

Carl: Thanks, Edna. Just the last one. If you want to test the positive and negative features of software, will you choose comparison test?

Edna: Yes, it's suitable. The comparison testing compares the strengths and weaknesses of a system with previous versions of the system or similar ones. People may confuse the comparison with the compatibility test.

Carl: I think the compatibility test is used to measure the system's performance when it's used with certain hardware, software, operative system, network, and different combinations of all.

Edna: You have that one clear! I think you don't need my help anymore.

Let's Practice!

If Edna helps Carl, he will understand the different testing types.

Instructions: Circle the correct the word to complete the sentence.

1. If Carl (need /needs /needed) help with his assignment, what will he ask Edna?
2. How will Edna help Carl with his assignment if it (is / are / be) about software testing?
3. If a software (is / are / were) tested by end-users before it is released to the market, will that be considered as a Beta test?
4. Will the acceptance test require the user to test the system to see if it (meet / meets / met) the requirements?
5. Will it be helpful if Edna (explain / explained / explains) the difference between Beta and Acceptance test to Carl?

Let's Practice!

There are different types of tests!

Instructions: Select the correct answer.

1. It's suitable to choose a comparison test to evaluate _____.
 - a. the size of the computers.
 - b. the positive features.
 - c. the color of the hardware.
 - d. the social networks.
2. To test the negative features of a software, you could use _____.
 - a. hardware and software manuals.
 - b. comparison testing.
 - c. computer evaluation program.
 - d. online tool for installation of devices.
3. Compatibility test may be used to measure the _____.
 - a. programs in the computer.
 - b. length of the cables.
 - c. system's performance.
 - d. installed games in the computer.
4. People may confuse the comparison test with _____.
 - a. the compatibility test.
 - b. the superlative test.
 - c. the evaluation program.
 - d. the beta version.
5. The comparison testing will compare the strengths and weaknesses of a system _____.
 - a. with the same system.
 - b. with an employee's performance.
 - c. with a tablet.
 - d. with similar systems.

Extension Activity

Understanding the Types of Software Testing

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about each type of software testing.
- Describe in a chart when it is more appropriate to use each type of testing. Include examples.
- Share your chart with the class.

Self-Assessment

Yes

No

- I look for more information about testing types. ☐ ☐
- I understand when a testing type is more appropriate than others and include examples. ☐ ☐
- I share my work with my classmates. ☐ ☐

Target Words

- **crystal clear** (expression): what someone says when there are no doubts about a topic and the person totally understood something.
e.g. It's crystal clear!
- **go beyond** (phrasal verb): to surpass or exceed a limit.
e.g. Programmers may create special conditions to go beyond the system's capacities.
- **measure** (verb): to quantify something.
e.g. I think the compatibility test is used to measure the system's performance when it's used with certain hardware, software, operative system, network, and different combinations of all.
- **end-user** (noun): person who ultimately uses a product.
e.g. The Beta is performed by end-users before the software is released to the market.
- **meet a requirement** (expression): to fulfill or achieve a demanded goal.
e.g. The acceptance test requires the user or customers to test the system to see if it meets the requirements.
- **feedback** (noun): opinion given in return evaluating something or someone's performance.
e.g. The Beta allows users to use the product and they provide feedback.

Conditional Sentences with If Clauses- Question Form

Conditional clauses are used to talk about a situation that becomes real or likely to happen only when a condition is fulfilled.

The usual conditional sentence is composed of 2 clauses: the **if clause** that explains the condition, and the other clause that presents the result or consequence.

There are different types of conditional sentences with different degrees of grammatical structures. The **first conditional** states something that might easily happen in the future.

Any of the two clauses can be affirmative, negative or even mixed in questions with conditional sentences. The **first conditional** uses the simple future in the **result clause** and simple present in the **if clause**.

Example:

*What computer **will** you buy **if** you need it to be good for programming?*

It's possible to put the **if clause** at the beginning of the question. In that case, a **comma** must be added.

Example:

***If** you need a good computer for programing, what computer **will** you buy?*

Examples

- *If I want to push the limits of software, what testing will I have to use?*
- *If you want to test the positive and negative features of software, will you choose a comparison test?*

Beta and Acceptance Testing

Beta and Acceptance Testing are fundamental because they engage users in the evaluation of software systems.

There are different types of software testing that involve different people in different parts of the whole process. In this opportunity, the Beta and Acceptance testing involve users in the fundamental part of a software system approval.

The **Beta version** of a software system is a trial for checking the system's performance with real users or end-users, who are the ones the product is addressed to, and pinpoint possible mistakes or whatever needs to be corrected or improved in the program.

The **Acceptance Testing** occurs when all flaws have been corrected and users, who can be an enterprise's employees, interact with the final version of the system. They focus on whether the software accomplishes the goal or not.
